inflatable mud **shoes**

FUNCTION

SELVADEK Mudshoes are designed for walking on mud and swampy terrains including in floating sands areas. Our solution for successfully moving on these challenging terrains is increased floatability. Selvadek Mudshoes are designed as supportive inflatable elliptical platforms.

The advantages of SELVADEK Mudshoes are various and crucial:

- » Our mudshoes are very light, with high raised boards and inflatable elliptical frame ensuring optimal weight distribution.
- » The flexible structure of the mudshoes adapts them very well to the terrains' relief.
- » The suspension strap system is universal for different types of shoes and ensures fixed-heel movement control.
- » The TPU anti-slip protectors and stainless steel crampons at the bottom of the mudshoes are designed to reduce the risk of slipping.
- » Anti-vacuum system comprised of gondola-like shaped Evapren component minimize the risk of being stuck in the mud.

For additional floatability and stability when walking, we have developed mudshoes poles that end with inflatable spherical modules. They ensure better movement control and dynamic balance.

Compactness - the wrapping up of the deflated mudshoes in a bag allows them to be easily carried and thus being always at disposal when needed including in extreme and emergency situations.

REFERENCE

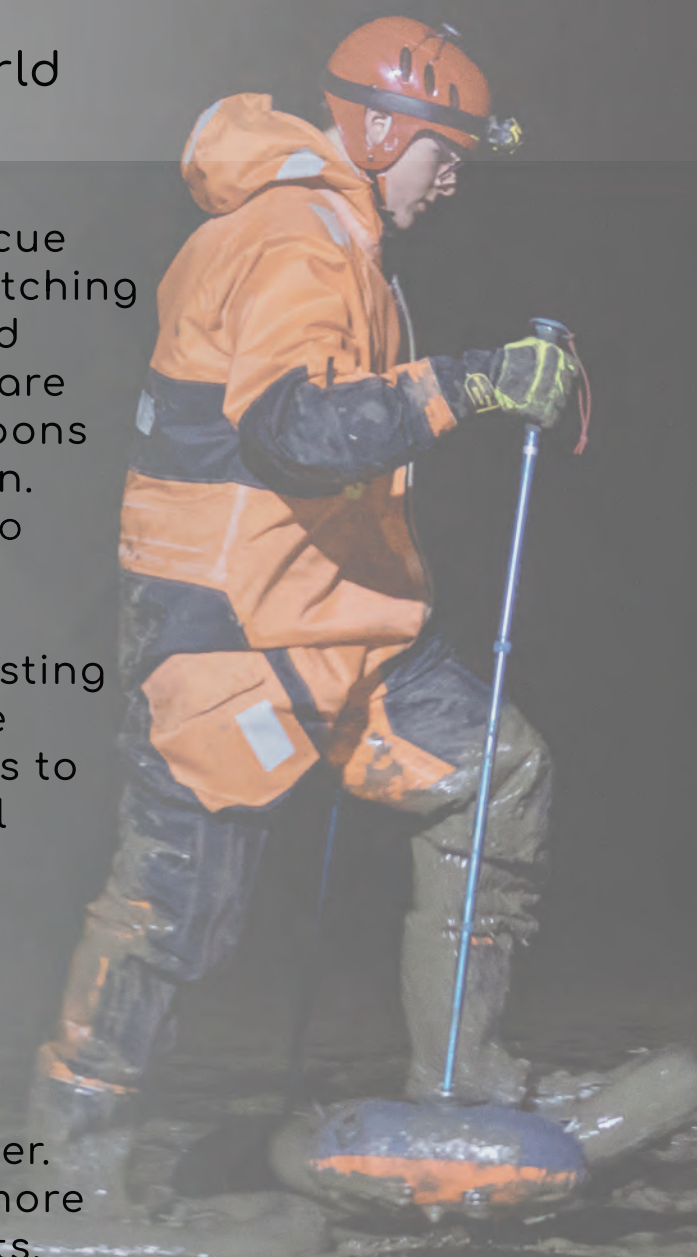

from the largest water rescue organization in the world
(German Life Saving Association DLRG)

Selvadek Mudshoes enable us to ensure more safety in our rescue operations. Whereas before we could only move forward by stretching our bodies in sliding motions on the mud surface - now the mud shoes offer us the possibility to walk upright. In addition, there are mudshoes poles for wading in the sticky mud waters and crampons on the bottom to have a firm position on the challenging terrain. Thus, once we reach the imperilled person our hands are free to effectively take care of the person in need.

The most difficult step during Selvadek Mudshoes prototype testing was to avoid the vacuum created under the mudshoes. With the latest developments Selvadek has managed to do this as well as to avoid the strong pulling forces that are exerted on the material during movement.

We are very happy to be able to use these new tools and have already shared the experience with other rescue organisations who are also enthusiastic to use Selvadek Mudshoes. Our cooperation with Selvadek is and has been very effective as we have gone through several stages of development together. We wish Selvadek and its future customers much success and more safety in usage and deployment of Selvadek innovative products.
